

Audion Office Image Optimizer

[Русский](#) · [User Guide](#)

Processes raster images **inside** Word documents and PowerPoint presentations, without taking the document apart.

Why It Exists

A document with photographs weighs a hundred megabytes because every image inside it is a phone picture at full resolution. It opens slowly, will not go by email, and behaves unpredictably in print.

The usual approach is to extract the images, process them, and put them back. That approach loses everything: position, text wrapping, captions, anchoring to the paragraph.

This program works on the images **in place**: the document stays the same document, and only what is inside the pictures changes.

Principles

The layout is untouched. Position, size on the page, wrapping, anchoring — all stay as they were. Pixels change, markup does not.

The colour profile is chosen explicitly. As in the other Audion programs: one thing for screen, another for print, and a person decides which.

The source is not modified. The result is written separately.

Technical Reference

Layout

<code>system_core\app\</code>	the code
<code>runtime\</code>	embedded Python
<code>config\</code>	defaults and colour profiles

Workbench Naming

One shared vocabulary across all Audion projects: **Source**, **Add file...**, **Target**, **Reset**, **Delete**, **List**.
