SHA-256: f9b21c5561fda15ea9e6481c0cdbd43f48891f129d8019a7cdb1b192d861997e

Portable project for processing embedded raster images inside Microsoft Office **DOCX** and **PPTX** files.

Current project layout:

- **system_core\app** contains the Python application code;
- **runtime** contains the embedded Python runtime;
- **config** contains defaults and ICC profiles;
- **GitHub** contains the main project documentation for releases and repository pages.

Main launchers in the project root:

- **launcher_project.cmd** - English launcher
- **launcher_project_picker.cmd** - English launcher with file picker
- **launcher_project_ru.cmd** - Russian launcher
- **launcher_project_picker_ru.cmd** - Russian launcher with file picker
- **launcher_gui.cmd** - desktop GUI shell over the existing CLI

Service launchers remain English-only:

- `builder_main.cmd` - build and packaging tools
- `launcher_tools.cmd` - service, licensing, and release tools

Python entry point:

- `runtime\python.exe -m app --help`
- `runtime\python.exe -m app scan "input\file.docx"`
- `runtime\python.exe -m app batch "input\file.docx" --mode hard --preset presentation`
- `runtime\python.exe -m app fit-size "input\file.docx" --target-mb 20`
- `runtime\python.exe -m app extract-media "input\file.docx"`

GUI optimization choice:

- **Standard resolutions**:
 - `1920x1080` - ordinary document;
 - `2560x1440` - presentations;
 - `3840x2160` - print / archive.
- **JPEG quality** - the shared compression lever for all GUI optimization modes, default `82`.
- **Custom size** - manual width/height for stronger or non-standard compression.
- **Fit to size** - a separate automatic operation for targets such as `20 MB`.

Standard resolution mode always runs **HARD**. Custom size mode exposes width/height number fields, **SAFE** / **HARD**, and the tiny-PNG override, which defaults to `400x400`.

Fit to size always uses **HARD JPG**: it first lowers JPEG quality to `75`, then reduces resolution down to `1920x1080`, then lowers quality to `65`, then tries `1600x900` and `1280x720`. Portrait images automatically receive rotated limits, for example `1920x1080` becomes `1080x1920`.

Reports include document size, embedded media size, decoded-size estimate, format summary, largest image parts, and per-image recommendations.

The GUI layer is focused on clear automatic workflows:

- inspect what is inside DOCX/PPTX files;
- optimize Office files through a clear resolution choice;
- fit a file under a target size in MB;

- normalize images to sRGB or CMYK;
- extract `word/media` and `ppt/media` into `output\<document-name>\`.
- choose a Source file/folder and a Target folder directly in the Workbench.

Canonical Workbench labels

The Workbench is the shared top-level routing block used by Audion NiceGUI projects. It contains the `Source` and `Target` address rows and these exact action labels: `Source`, `Add file...`, `Target`, `Reset`, `Delete`, and `List`.

`Source` can be one `DOCX` / `PPTX` file or a folder. `Target` is the results folder. Every operation uses the paths selected in the Workbench; operation screens do not duplicate input/output path fields.

`Reset` restores the project `input` and `output` routes.

The ordinary GUI hides technical image details. Standard resolutions run in `HARD`; safe optimization is available only in the manual `Custom size` mode.

Cleanup is intentionally narrower than normal I/O: it clears only the managed project `input` and `output` folders.

Interactive CLI/TUI paths such as `SAFE ASK` remain expert routes and are not the primary GUI workflow.

GUI adaptation notes and smoke gates are documented in:

- `docs\GUI_TEMPLATE_ADAPTATION_NOTES_RU.md`

Main GitHub materials:

- `GitHub\README.md`
- `GitHub\README_RU.md`
- `GitHub\Release Description (Audion Office Image Optimizer).md`
- `GitHub\source_docs\`

For normal use, keep the source document until the optimized copy has been opened and visually checked in the target Office application.
